Introduction

To intensify the strategic political dialogue on the proceeding transformation of energy systems in Germany and India, the German Chancellor and the Indian Prime Minister founded the Indo-German Energy Forum (IGEF) in April 2006.

To initiate strategic cooperation projects between the German and Indian governments, IGEF provides a communication platform for networking between research institutions and the private sectors of both countries. IGEF identifies opportunities to accelerate the energy transition of India and thus reduce carbon emissions.

The Indian energy market is transforming. Around-the-clock-tenders for renewable energy open up new possibilities. Large scale wind farms can already compete with the average price for electricity produced by coal (approx. 5 cents/kWh) and can be even cheaper per unit (approx. 3 cents/kWh). Thus, it needs to be evaluated whether wind farms yield enough energy during peak demand times to be a reliable energy source. If this is the case, wind farms could replace energy production with coal-fired power plants in the peak demand time and lower the overall energy production by fossil fuels. Furthermore, newly built wind farms could lead to an even more flexible operation of existing coal-fired power plants and an emerging energy mix, which again leads to fewer CO₂ emissions. On the one hand, this would help India achieve its climate goals for 2030, and on the other hand, it would make the construction of new coal-fired power plants redundant.

The objective of the current study is to identify and describe “peak wind speed generation clusters”, which are areas throughout India,

both onshore and offshore that fulfil the following criteria:

- The wind generation profile of the site is constantly high throughout the year during peak demand hours, especially evening hours 7 to 11 pm.
- The wind sites shall show a high electricity generation profile on an annual average (capacity factor for onshore wind farms >=20% and offshore wind farms >=40%).

The Indo-German Energy Forum (IGEF) had previously conducted an initial analysis of the daily and seasonal wind patterns in India to identify regions with strong wind speeds during peak demand hours. IGEF has provided EMD with the georeferenced maps prepared in these previous studies the ratio between mean power during the evening hours (7 to 11 pm) and the annual mean power.

EMD has conducted a detailed analysis of the provided maps and has combined them with wind resource maps from the Global Wind Atlas and with other geo-referenced information, to identify the potential of both onshore and offshore peak wind speed generation clusters in the different states of India.

In addition, Geographic Information System (GIS) data was used to classify each cluster based on variables relevant to wind farm development. The contractor further developed a method for estimating energy costs, which allows the classification of clusters.

Furthermore, the study identifies ten potential sites for wind farms in India, eight of which are onshore and two offshore, and describes them in detail.

Analysis of peak wind speed clusters

2.1 Data sources and methodology

EMD has combined diverse information from different sources for the analysis and classification of the “peak wind speed generation clusters”. Two variables were identified to form the clusters:

- The capacity factor for IEC 3 class wind turbines above 20% for onshore clusters and 40% for offshore clusters (see 2.1.1)
- Peak wind ratio above 1,2 (see 2.1.2)

As a result of this analysis, we found that nearly all states have areas where the conditions of capacity factor and peak wind speed are fulfilled. Further analysis and classification were thus carried out at the state level for the onshore cluster.

Additionally, two offshore clusters were identified: Gujarat and TamilNadu.

2.1.1 Wind resource

The wind resource throughout India was analysed with information obtained from the Global Wind Atlas and following information was downloaded at 100 m height above the ground:

- Wind speed, Weibull A factor and Weibull k factor
- The capacity factor for IEC 1 class wind turbines
- The capacity factor for IEC 2 class wind turbines
- The capacity factor for IEC 3 class wind turbines

The capacity factor for IEC 3 class wind turbines was a criterion to define peak wind speed generation clusters:

- Only areas throughout India with a capacity factor for IEC 3 class wind turbines above 20% were chosen to form part of the onshore peak wind speed generation clusters.
- Only areas throughout India with a capacity factor for IEC 3 class wind turbines above 40% were chosen to form part of the offshore peak wind speed generation clusters.

Furthermore, the IEC class was evaluated based on the mean wind speed and the covered land surface for each IEC class was determined.

- < 7,5 m/s = IEC 3
- 7,5 ... 8,5 m/s = IEC 2
- 8,5 ... 10 m/s = IEC 1
- 10 m/s = IEC S

2.1.2 The ratio of wind speed

IGEF has provided EMD with georeferenced maps with information on the ratio between mean power during the evening hours (7 to 11 pm) and the annual mean power. These maps were prepared in the following study:

[1] Analysis of Daily and Seasonal Variation of Wind Resource in India, Deutsche Windguard, 30 September of 2020 (DWG Project Nr. VC20217 and DWG Report Nr. PE20014.A0).

The following information was integrated into the analysis:

- grid_daily_pattern_RatiosPeakHoursDaily_nonSeasonal - map showing the ratio between the mean power during the defined peak hours compared to the annual mean power
- grid_daily_pattern_ratios_PeakHoursSummer-PeakHoursYear - map showing the ratio in mean power during

the peak hours in the summer season (peak of the peak hours) and the annual mean power during the peak hours

The ratio between the mean power during the defined peak hours compared to the annual mean power, called peak wind ratio in the following analysis, was the second criterion to define peak wind speed generation clusters. Only areas with a peak wind ratio above 1,2 were chosen to be part of the peak wind speed generation clusters.

2.1.3 Site complexity (only onshore)

Site complexity is being evaluated based on satellite surface data using the information of Globcover.

- Cities and water bodies are classified as excluded areas, which are unsuitable for the installation of wind turbines.
- Forests and floodable areas are classified as restricted areas with implications in the cost of energy (higher capex).

The analysis shows that after defining the land surface that complies with “peak wind speed generation” conditions, the additional constraints (cities, lakes) and limitations (forest, floodland) to the installation of wind turbines cause only very small changes to the net surface (less than 1%).

2.1.4 Electrical infrastructure (only onshore)

The electrical infrastructure was evaluated from online material coming from the Center for Study of Science, Technology and Policy (CSTEP).

Georeferenced transmission lines were accessed at:

http://darpan.cstep.in/reatlas/transmission_lines_national.geojson

The GIS analysis of the distance to High Voltage (HV) lines has implications on the cost of energy since an increase in the balance of plant capex was assumed for each km of distance.

Except for Jammu and Kashmir, all states have access to the national electrical grid. States with the lowest grid density are Orissa, West Bengal, and Rajasthan; all other states have an average distance to the nearest HV line of fewer than 10 km.

2.1.5 Project logistics (only offshore)

EMD has researched offshore capabilities in India and has revised the FOWIND study.

[1] Supply chain, port infrastructure and logistics study for offshore wind farm development in Gujarat and Tamil Nadu, Fowind, June 2016

The study clarifies “that no single port estate in India is currently [2016] suitable to facilitate all offshore wind construction activities without some level of adaptation or with the strategic use of multiple port estates” but identifies the following “promising port estates”:

- Hazira and Pipavav (Gujarat)
- Tuticorin (Tamil Nadu)

In addition, the distance to the shoreline was identified.

2.1.6 Capacity density

To determine the potential wind energy generation capacity per square kilometre, literature research was conducted:

[1] Data investigation of installed and output power densities of onshore and offshore wind turbines worldwide, Peter Enevoldsen, Mark Z. Jacobson, 2020, Energy for Sustainable Development

[2] Capacity densities of European offshore wind farms, Deutsche WindGuard, 2018

[3] Two methods for estimating limits to large-scale wind power generation, Lee M. Miller, Nathaniel A. Brunsell, David B. Mechem, Fabian Gans, Andrew J. Monaghan, Robert Vautard, David W. Keith und Axel Kleidon, Proceedings of the National Academy of Sciences, 2015

[1] concludes that the mean (range) installed, and output power densities of onshore wind farms are 20 MW/km² (range: 6 – 48

MW/km²) and of offshore wind farms are 7 MW/km² (range: 3 – 20 MW/km²); [2] informs a similar capacity density for offshore wind farms.

However, [3] alerts that for large scale installations, “the correlation between the amount of energy generated and the number of wind turbines is not linear, as more turbines increasingly slow down the wind”, identifying a maximum of 1,1 MW/km² for the wind capacity density.

In our evaluation, we adopted the conservative value of 1,1 MW/km² both for onshore and offshore wind farms.

2.1.7 Levelized cost of energy (LCOE)

The cost of generation or levelized cost of energy (LCOE) is a concept widely used in the electric power industry to compare different generation solutions. It divides the discounted cash flow (capex and opex) by the discounted flow of energy at the same discount rate. In this way, it determines the "generation cost" for which the income (amounts of energy generated multiplied by LCOE) equals the investment costs: capex, opex and capital cost. It should be noted that the concept of LCOE does not take into consideration the fiscal cost.

$$LCOE = \frac{\sum_{i=1}^n \frac{capex_i + opex_i}{(1+r)^i}}{\sum_{i=1}^n \frac{E_i}{(1+r)^i}}$$

To determine the levelized cost of energy, we made the following assumptions:

- Capex for onshore wind farms = 875 kUSD/MW
- Additional Capex for installations in forest +15%
- Additional Capex for installations in flooded areas +50%
- Additional Capex for connection to the nearest HV line = 4kUSD/MW per km
- Capex for offshore wind farms = 1.600 kUSD/MW
- Opex for onshore wind farms = 11,8 kUSD/MW/year
- Opex for offshore wind farms = 30 kUSD/MW/year
- Cost of capital: 6,3% (equity return 4,5%, interest 9,8%, tax 30%)

2.2 Results of analysis

2.2.1 Peak wind generation capacity

The analysis identifies extensive areas across India that comply with the criteria of a capacity factor above 20% (onshore) / 40% (offshore) and a peak wind speed ratio above 1,2 (“peak wind speed generation” conditions); a total of 736.000 km².

Twelve states with a minimum surface of 1.000 km² have more than 10% of their land surface with peak wind speed generation conditions and are further analysed in this section of the report. Out of the states with less than 1.000 km² surface, Puducherry and Daman and Diu also have more than 10% of their land surface with peak wind speed generation conditions.

Table 1: Surface of states and their net surface with peak wind speed generation conditions

State	Surface [km2]	Net surface [km2]	%
Gujarat	196.244	127.185	65%
Andhra Pradesh	162.968	85.180	52%
Karnataka	191.791	97.633	51%
Tamil Nadu	130.060	64.883	50%
Bihar	94.163	31.034	33%
Maharashtra	307.713	88.962	29%
Uttar Pradesh	240.928	55.123	23%
West Bengal	88.752	16.119	18%
Haryana	44.212	7.680	17%
Madhya Pradesh	308.252	53.131	17%
Rajasthan	342.239	55.294	16%
Orissa	155.707	18.010	12%

The analysis also identifies two offshore clusters off the coasts of Gujarat and Tamil Nadu.

With a capacity density of 1,1 MW/km2 for both onshore and offshore wind farms, the net surface with peak wind speed generation conditions translates into 777 GW onshore capacity and 32 GW offshore capacity.

Most of the generation capacity is in IEC class 3 environments.

Existing wind farms are not a limitation to the development of new sites in any state, the highest current wind farm penetration is in Rajasthan with 6,4% of the wind farm potential currently installed.

Table 2: The net surface of offshore clusters with peak wind speed generation conditions

State	Net surface [km2]
Gujarat	9.478
Tamil Nadu	19.871

Table 3: Peak wind speed generation capacities by IEC class

State	Total [GW]	IEC I [GW]	IEC II [GW]	IEC III [GW]
Gujarat – onshore	139,9	0	0,6	139,3
Karnataka	107,4	0,1	0,5	106,8
Maharashtra	97,9	0	0,2	97,6
Andhra Pradesh	93,7	0	0,3	93,4
Tamil Nadu – onshore	71,4	0,2	1,5	69,7
Rajasthan	60,8	0	0	60,8
Uttar Pradesh	60,6	-	-	60,6
Madhya Pradesh	58,4	-	0	58,4
Bihar	34,1	-	-	34,1

Haryana	8,4	-	-	8,4
Punjab	2,8	-	-	2,8
Chhattisgarh	1,8	-	0	1,8
Jharkhand	1,1	-	0	1,1
Gujarat - offshore	10,4	-	0,7	9,7
Tamil Nadu - offshore	21,9	0	3,6	18,2

Table 4: Peak wind speed generation capacities vs installed capacities

State	Total [GW]	Installed [GW]	%
Rajasthan	60,8	3,9	6,4%
Maharashtra	97,9	5,1	5,2%
Tamil Nadu	71,4	3,2	4,5%
Andhra Pradesh	93,7	3,9	4,2%
Karnataka	107,4	3,2	3,0%
Madhya Pradesh	58,4	1,7	2,9%
Gujarat	139,9	3,6	2,6%

2.2.2 Capacity factors

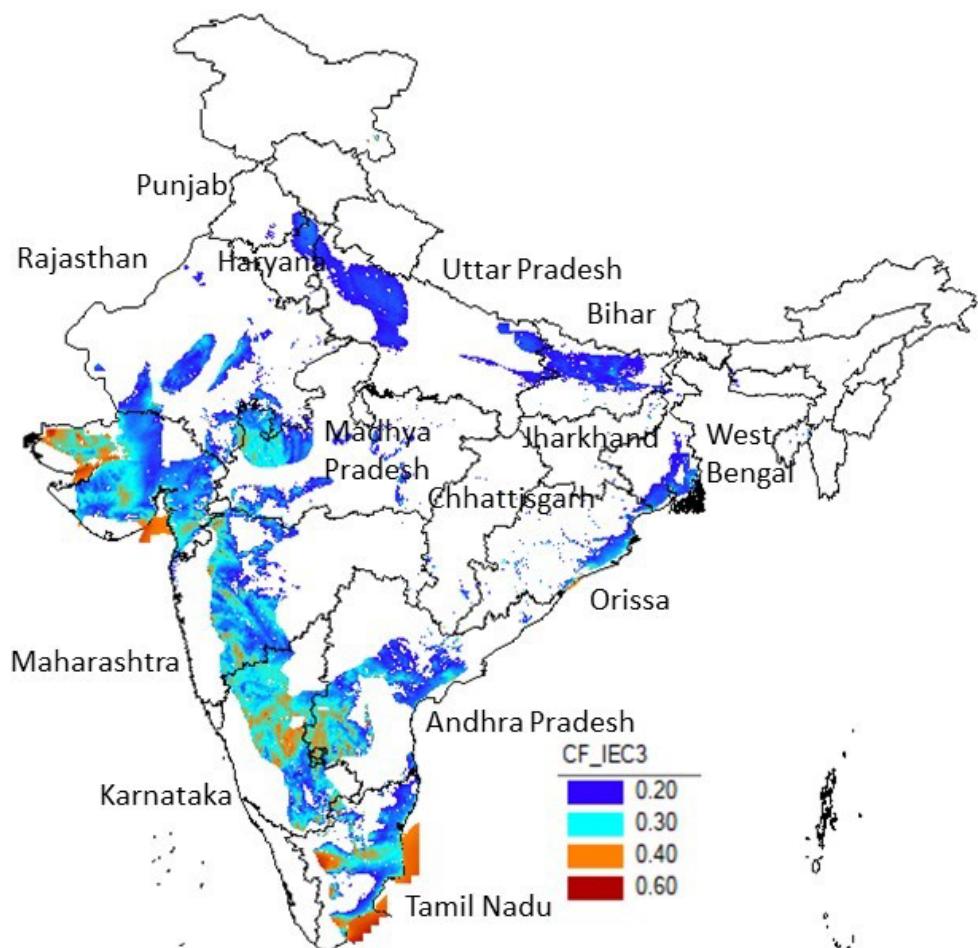

Onshore average capacity factors for IEC class 3 wind turbines above 25% can be found in the

states Karnataka, Tamil Nadu, Gujarat, Andhra Pradesh, and Maharashtra. These are also the states with the highest maximum capacity factors.

Table 5: Capacity factors IEC class 3

State	Mean	Stddev	Min	Max
Tamil Nadu – offshore	45%	4%	40%	61%
Gujarat – offshore	44%	3%	40%	54%
Karnataka	30%	5%	20%	65%
Tamil Nadu – onshore	29%	7%	20%	63%
Gujarat – onshore	28%	5%	20%	69%
Andhra Pradesh	27%	5%	20%	64%
Maharashtra	27%	5%	20%	63%
Madhya Pradesh	25%	4%	20%	53%
Orissa	25%	4%	20%	53%
Rajasthan	24%	3%	20%	57%
Haryana	23%	1%	20%	35%
West Bengal	23%	2%	20%	38%
Uttar Pradesh	21%	1%	20%	28%
Bihar	21%	1%	20%	41%

Figure 1: Capacity factors IEC class 3

2.2.3 Wind speed ratio

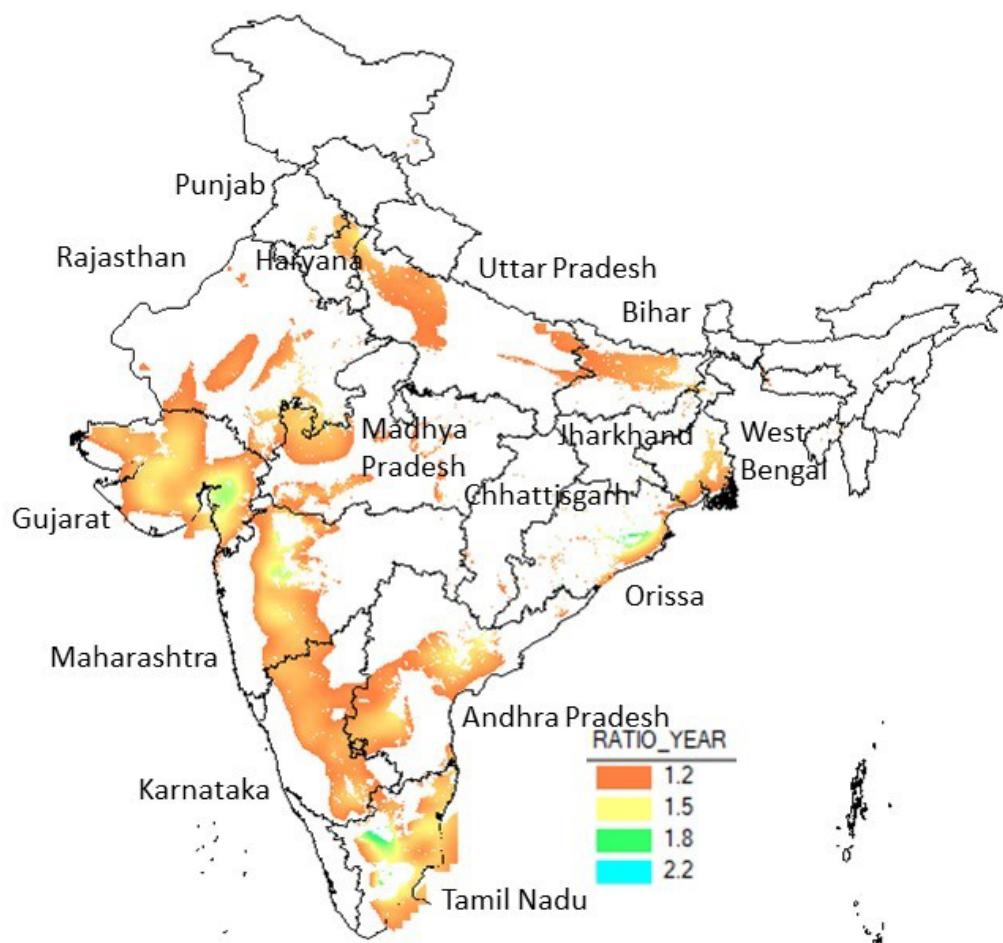

The highest average wind speed ratios can be found in the states Tamil Nadu (on- and offshore), Orissa, Gujarat (on- and offshore),

Haryana, Maharashtra, West Bengal, and Andhra Pradesh. In some of these states, sites with wind speed ratios above 1,8 and 2,0 can be found.

Table 6: Wind speed ratios

State	Mean	Stddev	Min	Max
Tamil Nadu – offshore	1,31	0,05	1,20	1,45
Gujarat – offshore	1,31	0,07	1,20	1,52
Tamil Nadu - onshore	1,39	0,12	1,20	2,12
Orissa	1,37	0,14	1,20	1,94
Gujarat – onshore	1,36	0,09	1,20	1,63
Haryana	1,35	0,05	1,20	1,48
Maharashtra	1,33	0,09	1,20	1,64
West Bengal	1,33	0,07	1,20	1,56
Andhra Pradesh	1,30	0,08	1,20	1,84
Madhya Pradesh	1,29	0,06	1,20	1,45
Karnataka	1,28	0,04	1,20	1,42
Bihar	1,28	0,04	1,20	1,41
Rajasthan	1,27	0,07	1,20	1,51
Uttar Pradesh	1,25	0,05	1,20	1,50

Figure 2: Wind speed ratios

2.2.4 Levelized cost of energy (LCOE)

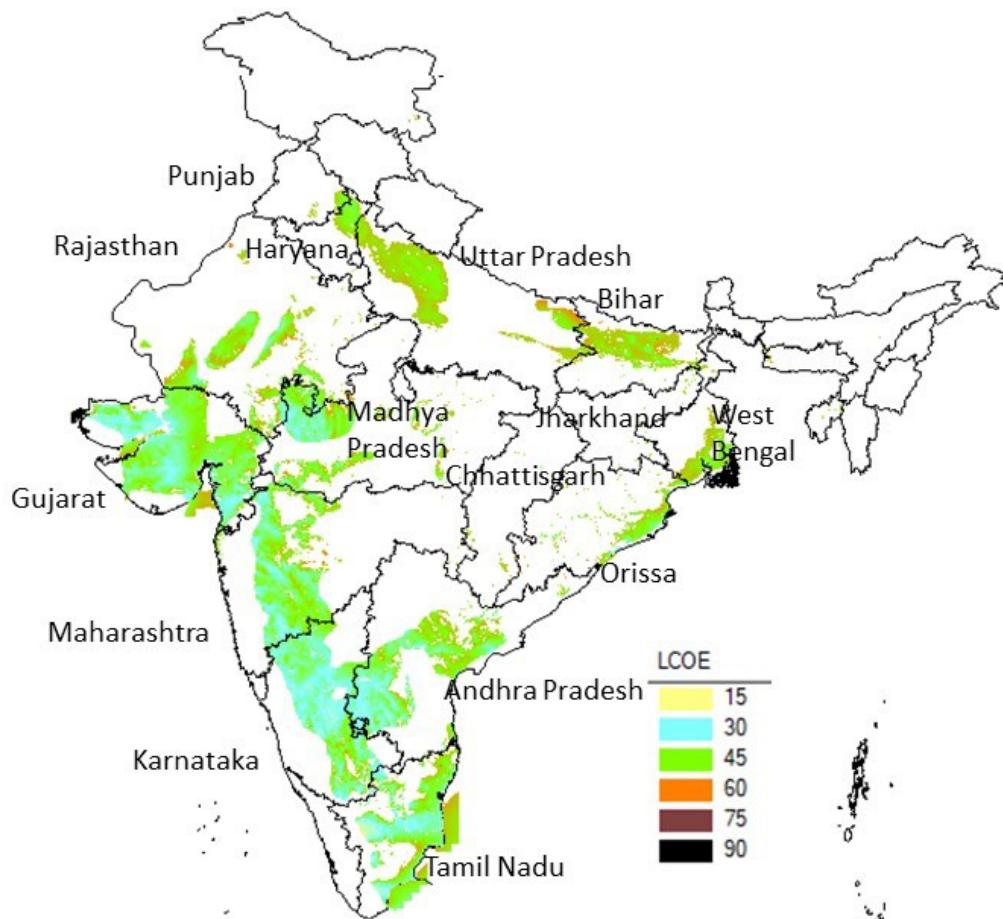

The lowest average Levelized cost of energy (LCOE) can be found in the states of Karnataka,

Tamil Nadu (on- and offshore), Gujarat (on- and offshore), Andhra Pradesh and Maharashtra.

Table 7: Levelized cost of energy (LCOE)

State	Mean	Stddev	Min	Max
Tamil Nadu – offshore	47,9	4,2	34,4	55,8
Gujarat – offshore	49,4	3,8	39,4	55,2
Karnataka	35,7	6,0	15,7	76,2
Tamil Nadu – onshore	38,4	8,1	16,6	76,0
Gujarat – onshore	38,6	6,3	15,0	75,0
Andhra Pradesh	40,3	7,4	16,5	77,4

Uttar Pradesh	49,2	2,7	39,8	81,6
Bihar	49,6	3,1	25,6	86,3

Figure 3: Levelized cost of energy (LCOE)

2.3 Peak wind speed site analysis

This section describes the results of the detailed analysis of ten potential wind farm sites, eight of them onshore and two offshore. The sites were selected in seven different states in environments that combine high wind speed ratios and high capacity factors, thus low LCOE.

2.4 Data sources and methodology

The detailed site analysis was conducted in windPRO using a combination of mesoscale and microscale modelling. Meso scale modelling was conducted in Weather Research and Forecasting (WRF) and these data were then long term correlated and micromodelled with WAsP. Data sources for the models were ERA5 for the wind data, Copernicus Digital Elevation Model DEM GLO-30 for elevation data and GlobCover for roughness data.

To make site assessment comparable, the same IEC class 3 wind turbine model was selected in all ten sites, simulating a wind farm consisting of 12 Vestas V150-4,2 MW with a hub height of 105 m, totalling 50,4 MW in each site. When selecting the individual wind turbine positions, we made sure that these positions were not placed in protected areas (according to Open Street Maps) nor interfered with existing wind turbine positions (as identified in Google Earth).

Wake loss was determined for each wind farm configuration with the N.O. Jensen model applying the DTU default wake decay constant for onshore and offshore wind farms.

The power curve of the V150-4,2 MW was adjusted to the local air density using pressure and temperature measurements from nearby weather stations. To account for additional losses, a lump sum 8% loss factor was applied to the energy production after wake loss.

2.5 Results of analysis

The results of the analysis are presented in ten preliminary energy yield reports that inform the specific input data, the positions of the wind turbines, the energy production forecast, and its daily and seasonal distribution. Heat maps were created in excel format that visualizes the distribution of the energy production and the capacity factors in six-time slots of four hours each and the 12 months of the year.

The representation of the spatial variability of the resource obtained from this modelling is generally very accurate, but it needs to be noted that WRF model output can be subject to high bias and the magnitude of the wind speed must be confirmed in a measurement campaign before any investment decision.

The energy production values and their implication in the energy cost must therefore be interpreted as preliminary. This is especially the case for Saharanpur in Uttar Pradesh; since in this case, no WRF model could be conducted due to the proximity of the Himalayan mountain range. We used modified re-analysis data for the production analysis, with much higher uncertainty than the meso scale data modelled with WRF.

Table 8: Results of site analysis

Report number	Site/ City	State	Production	Capacity factor
21-459-001	Dhenkanal	Orissa	98.090 MWh	22,2%
21-459-002	Chilika	Orissa	139.098 MWh	31,5%
21-459-003	Kharagpur	West Bengal	90.859 MWh	20,6%
21-459-004	Saharanpur	Uttar Pradesh	103.560 MWh	23,5%
21-459-005	Offshore	Gujarat	188.085 MWh	42,6%
21-459-006	Arnod	Gujarat	112.712 MWh	25,5%
21-459-007	Erode	Tamil Nadu	100.780 MWh	22,8%
21-459-008	Offshore	Tamil Nadu	192.133 MWh	43,5%
21-459-009	Harapanahalli	Karnataka	188.728 MWh	42,7%
21-459-010	Proddatur	Andhra Pradesh	203.659 MWh	46,1%

Description of the data sources and tools

The Center for Study of Science, Technology and Policy (CSTEP) is one of India's leading think tanks, with a mission to enrich policymaking with innovative approaches using science and technology for a sustainable, secure, and inclusive society. For additional information: <https://cstep.in/>

Copernicus Digital Elevation Models (DEM) is a set of Digital Elevation Models with global coverage released by the European Space Agency (ESA). Two instances of this dataset are available to the public: a global model at 90m resolution (Copernicus DEM GLO-90) and a near-global model at 30m resolution (Copernicus DEM GLO-30). The Copernicus DEM is a digital surface model (DSM) and it includes all surface structures - like buildings, infrastructure and forests. The Copernicus DEM is derived from an edited DSM named WorldDEM™ with the WorldDEM™ model being based on radar satellite data from the TanDEM-X mission. The WorldDEM model has been infilled on a local basis with other DEMs, such as ASTER, SRTM90, SRTM30, SRTM30plus, GMTED2010, TerraSAR-X Radargrammetric DEM and ALOS World 3D-30m. Produced using Copernicus WorldDEM-30 © DLR e.V. 2010–2014 and © Airbus Defence and Space GmbH 2014–2018 provided under COPERNICUS by the European Union and ESA; all rights reserved. For additional information: <https://spacedata.copernicus.eu/web/cscda/dataset-details?articleId=394198>

ERA5 is a climate reanalysis dataset developed through the Copernicus Climate Change Service (C3S) and processed/delivered by the European Centre for Medium-Range Weather Forecasts ECMWF. The dataset is the successor to the popular but now discontinued ERA-Interim dataset. The ERA5 dataset has several improvements compared to ERA-Interim: A newer modelling system, more observations and higher spatial resolution (31 km) from a native Gaussian modelling grid. For additional

information:

[https://help.emd.dk/mediawiki/index.php?title=ERA5_\(Gaussian_Grid\)](https://help.emd.dk/mediawiki/index.php?title=ERA5_(Gaussian_Grid))

Global Wind Atlas 3.0, is a free, web-based application developed, owned, and operated by the Technical University of Denmark (DTU).

The Global Wind Atlas 3.0 is released in partnership with the World Bank Group, utilizing data provided by Vortex, using funding provided by the Energy Sector Management Assistance Program (ESMAP). For additional information: <https://globalwindatlas.info>

GlobCover is an ESA initiative that began in 2005 in partnership with JRC, EEA, FAO, UNEP, GOFC-GOLD and IGBP. The project aimed to develop a service capable of delivering global composites and land cover maps using input observations from the 300m MERIS sensor onboard the ENVISAT satellite mission. ESA makes available the land cover maps, which cover 2 periods: December 2004 – June 2006 and January – December 2009. For additional information:

http://due.esrin.esa.int/page_globcover.php

WASP is the industry standard for linear flow modelling and energy yield calculation for wind turbines and wind farms. For additional information: <https://www.wasp.dk/>

windPRO is the industry leading software suite for the design and planning of wind farm projects. Successfully used by both large corporations and small entrepreneurs, windPRO is recognized and accepted by banks and authorities worldwide. For additional information: <https://www.emd-international.com/windpro/>

The Weather Research and Forecasting (WRF) Model is a next-generation mesoscale numerical weather prediction system designed for both atmospheric research and operational forecasting applications. It features two dynamical cores, a data assimilation system, and a software architecture supporting parallel

computation and system extensibility. The model serves a wide range of meteorological applications across scales from tens of meters to thousands of kilometres. The effort to develop WRF began in the latter 1990s and was a collaborative partnership of the National Center for Atmospheric Research (NCAR), the National Oceanic and Atmospheric Administration (represented by the National

Centers for Environmental Prediction (NCEP) and the Earth System Research Laboratory), the U.S. Air Force, the Naval Research Laboratory, the University of Oklahoma, and the Federal Aviation Administration (FAA). For additional information:

Yield Assessment - Chilika, Orissa

PARK - Main Result

Calculation: 22-459-002 Chilika - Orissa

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 43
At the site centre the difference between grid north and true north is: -0,8°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,075 DTU default onshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 750 m (5,0 RD)

Scaler/wind data

Name	EMD Default Measurement Mast Scaler
Terrain scaling	Measured Data Scaling (WASP Stability / A-Parameter)
Micro terrain flow model	WASP IBZ from Site Data
Used period	1/1/2002 04:30:00 - 1/1/2022 04:30:00
Meteo object(s)	EmdWrf_N19.632_E085.363 - Chilika
Displacement height	Omnidirectional from objects
WASP version	WASP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.

PARK - Time varying AEP

Calculation: 22-459-002 Chilika - Orissa

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

Yield Assessment - Kharagpur, West Bengal

PARK - Main Result

Calculation: 22-459-003 Kharagpur WB

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 43
At the site centre the difference between grid north and true north is: -0,8°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,075 DTU default onshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 750 m (5,0 RD)

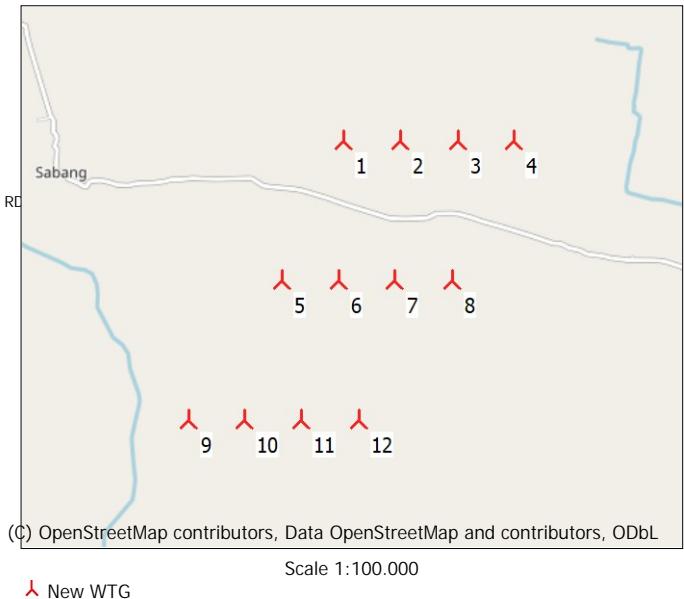

Scaler/wind data

Name	EMD Default Measurement Mast Scaler
Terrain scaling	Measured Data Scaling (WAsP Stability / A-Parameter)
Micro terrain flow model	WAsP IBZ from Site Data
Used period	1/1/2002 04:30:00 - 1/1/2022 04:30:00
Meteo object(s)	EmdWrf_N22.143_E087.653 - WB
Displacement height	Omnidirectional from objects
WAsP version	WAsP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.

PARK - Time varying AEP

Calculation: 22-459-003 Kharagpur WB

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

PARK - Time varying AEP

Calculation: 22-459-004 Saharanpur UP

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

Yield Assessment - Off-shore, Gujarat

PARK - Main Result

Calculation: 22-459-005 Gujarat off-shore

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 43
At the site centre the difference between grid north and true north is: -0,8°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,050 DTU default offshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 1.200 m (8,0)

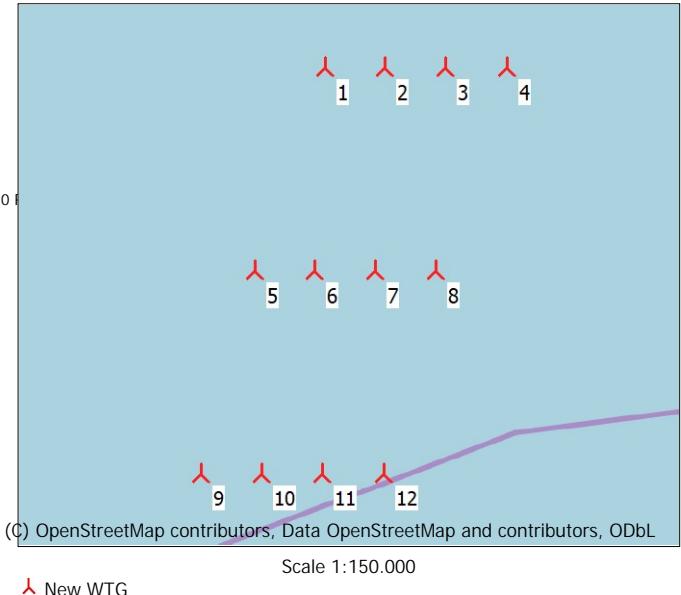

Scaler/wind data

Name	EMD Default Measurement Mast Scaler
Terrain scaling	Measured Data Scaling (WASP Stability / A-Parameter)
Micro terrain flow model	WASP IBZ from Site Data
Used period	1/1/2002 04:30:00 - 1/1/2022 04:30:00
Meteo object(s)	EmdWrf_N20.899_E072.300 - Gujarat off-shore
Displacement height	Omnidirectional from objects
WASP version	WASP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.
				[%]	[%]	[%]

PARK - Time varying AEP

Calculation: 22-459-005 Gujarat off-shore

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

Yield Assessment - Arnod, Gujarat

PARK - Main Result

Calculation: 22-459-006 Arnod Gujarat

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 43
At the site centre the difference between grid north and true north is: -0,8°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,075 DTU default onshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 750 m (5,0 RD)

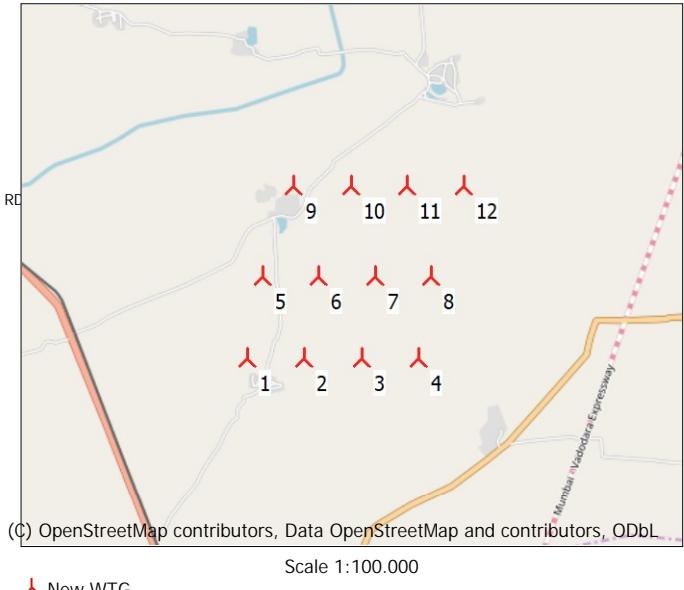

Scaler/wind data

Name	EMD Default Measurement Mast Scaler
Terrain scaling	Measured Data Scaling (WAsP Stability / A-Parameter)
Micro terrain flow model	WAsP IBZ from Site Data
Used period	1/1/2002 04:30:00 - 1/1/2022 04:30:00
Meteo object(s)	EmdWrf_N21.920_E072.925 - Gujarat
Displacement height	Omnidirectional from objects
WAsP version	WAsP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.

Yield Assessment - Off-shore, Tamil Nadu

PARK - Main Result

Calculation: 22-459-008 Tamil Nadu off-shore

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 43
At the site centre the difference between grid north and true north is: -0,8°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,050 DTU default offshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 1.200 m (8,0)

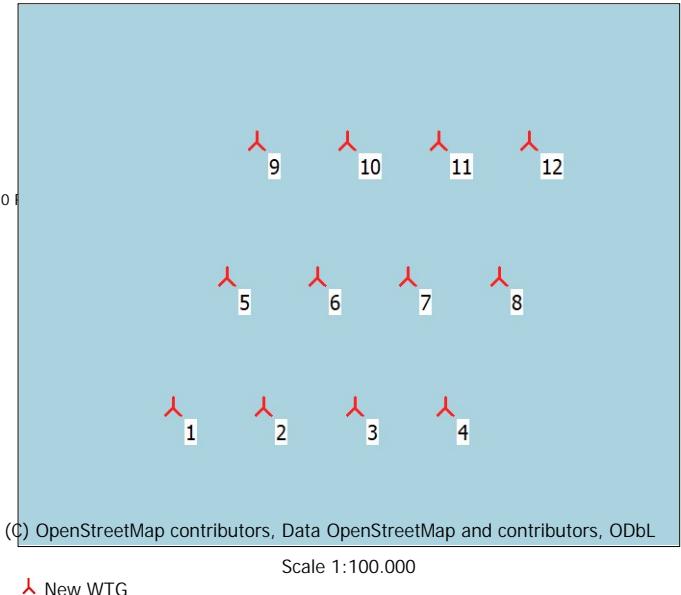

Scaler/wind data

Name	EMD Default Measurement Mast Scaler
Terrain scaling	Measured Data Scaling (WASP Stability / A-Parameter)
Micro terrain flow model	WASP IBZ from Site Data
Used period	1/1/2002 03:30:00 - 1/1/2022 03:30:00
Meteo object(s)	EmdWrf_N08_910_E078.360 - TN offshore
Displacement height	Omnidirectional from objects
WASP version	WASP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.
				[%]	[%]	[%]
Air density						
From air density settings [°C]	24,8	24,8	24,8

Yield Assessment - Harapanahalli, Karnataka

PARK - Main Result

Calculation: 22-459-009 Harapanahalli - Karnataka

Setup

AEP scaled to a full year based on number of samples
Scaling factor from 20,0 years to 1 year: 0,050

Calculation performed in UTM (north)-WGS84 Zone: 44
At the site centre the difference between grid north and true north is: -0,7°

Wake

Wake Model: N.O. Jensen (RISØ/EMD)

Wake decay constant

Wake decay constant: 0,075 DTU default onshore

Reference WTG: 4*VESTAS V150-4.2 4200 150.0 IO! hub: 105,0 m (TOT: 180,0 m) dist: 750 m (5,0 RD)

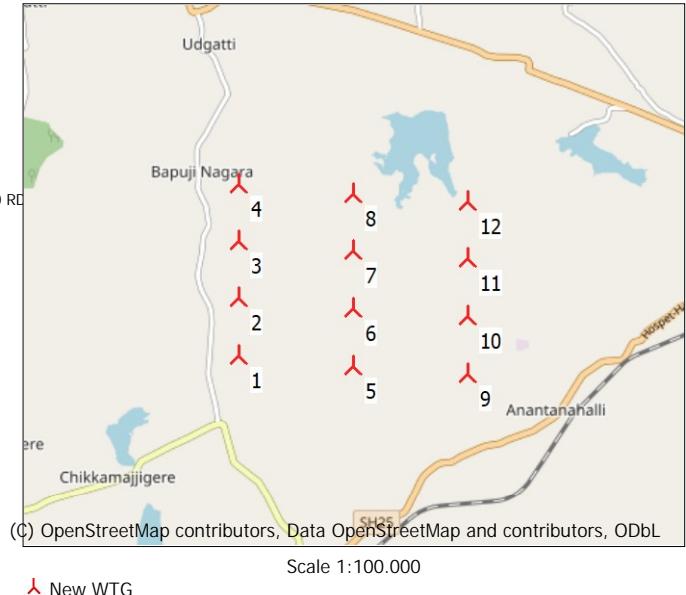

Scaler/wind data

Name EMD Default Measurement Mast Scaler
Terrain scaling Measured Data Scaling (WAsP Stability / A-Parameter)
Micro terrain flow model WAsP IBZ from Site Data
Used period 1/1/2002 04:30:00 - 1/1/2022 04:30:00
Meteo object(s) EmdWrf_N14.779_E075.910 - KA
Displacement height Omnidirectional from objects
WAsP version WAsP 11 Version 11.06.0028

Power correction

Power curve correction (adjusted IEC method, improved to match turbine control)

	Min	Max	Avg	Corr.	Neg. corr.	Pos. corr.
				[%]	[%]	[%]
Air density

PARK - Time varying AEP

Calculation: 22-459-009 Harapanahalli - Karnataka

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

PARK - Time varying AEP

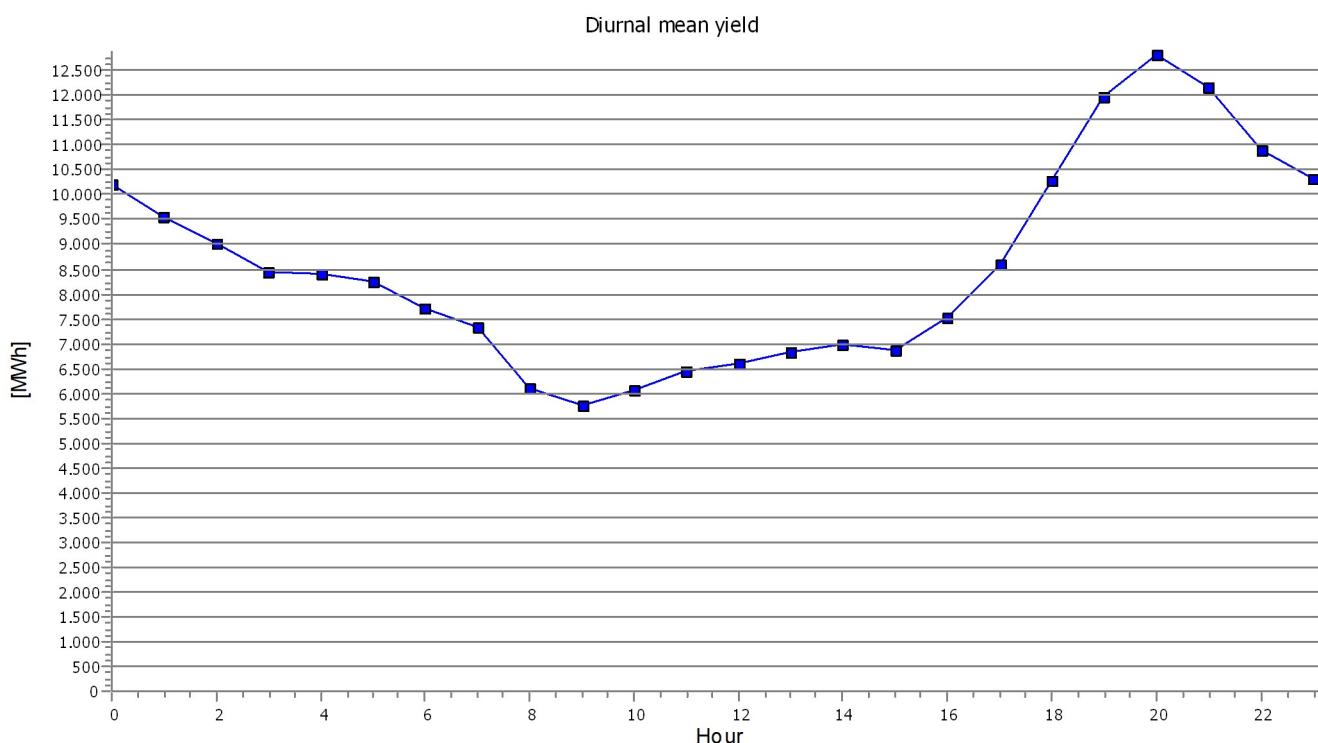

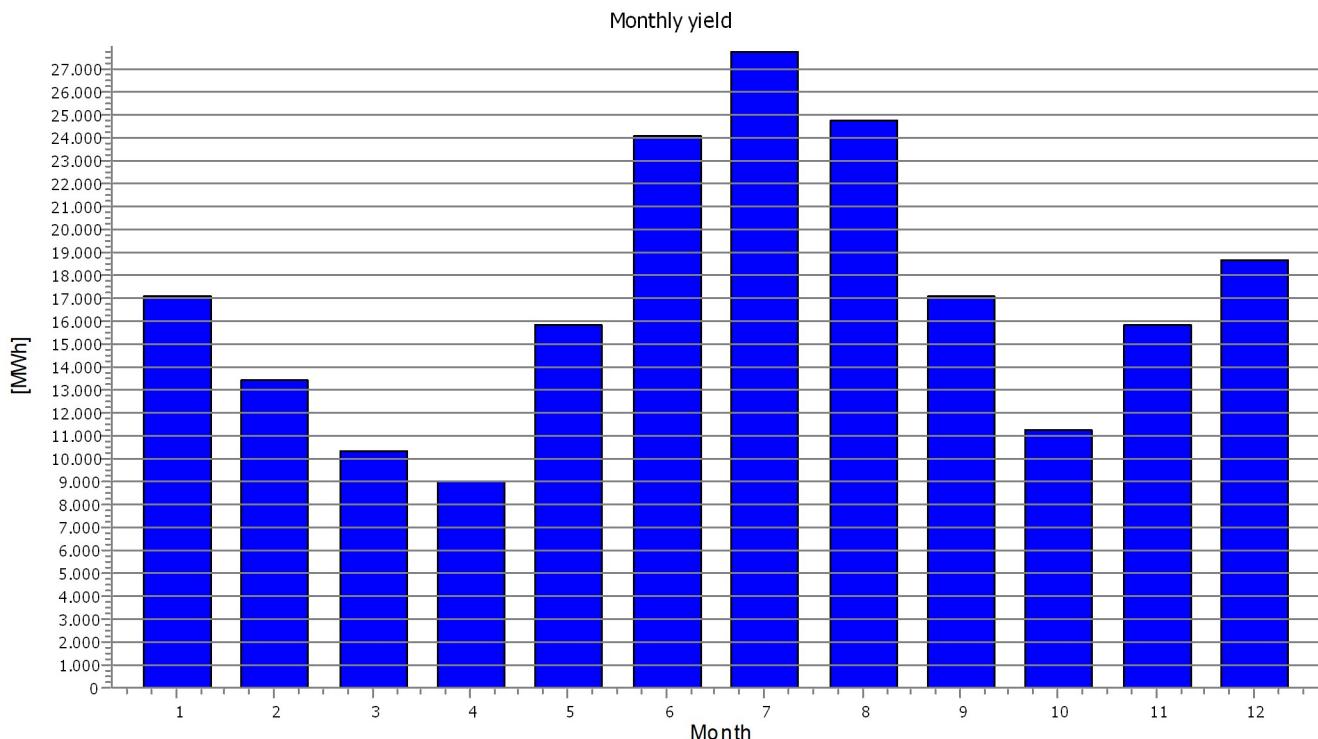

Calculation: 22-459-009 Harapanahalli - Karnataka

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.

PARK - Time varying AEP

Calculation: 22-459-010 Proddatur AP

Windfarm: 50,4 MW based on 12 turbines of type VESTAS V150-4.2 4200 150.0 !O!.

Selection: All new WTGs

Calculated mean yield per month and hour [MWh]. The result includes wake losses and any curtailment losses.

Values are scaled to a full year, see correction factors at main result page.
